THALES PREPARATORY TEST 2019 DETAILED SOLUTIONS

1. The missing number in the equation: $8 \times 3 = 4 \times ?$ is 6.
2. The sum of $8 + 50 + 200 + 6\,000$ is 6 258.
3. The value of $(15 \div 3) \times (16 - 9)$ is a multiple of (5×7) 5.
4. 20 nickels = 4 quarters.
5. The fraction of the hexagon that is shaded is $1/6$.

6. A natural number is multiplied by 7. The result could not be 88.
7. There are $((2 \times 6 - 1) + 3)$ 14 blocks in the pile?
8. If the last day of January is a Wednesday, then January 10 (31, 24, 17, 10) was a Wednesday and January 11 was a Thursday.

9. When twice 100 (200) is multiplied by one quarter of 12 (3), the result is (200×3) 600.
10. 10 dm = 1 m

11. T, U, V, W, X, Y, and Z are players that participated in a chess tournament. $T \rightarrow U$ means that T has won a game against U. Only one player (Z) has not won a single game.

12. A 2-digit natural number is multiplied by a 2-digit natural number. The product could have a minimum of $(10 \times 10 = 100)$ 3 digits, but must have less than $(100 \times 100 = 10\,000)$ 5 digits. The product could be a natural number that has 4 digits.

13. The $3!!$ does not refer to the double factorial function (which is way beyond the scope of this test) but to the factorial function iterated twice. The expression $3!!$ means here $(3!)!$. The value of $3!!$ is $(3!)! = 6!$. The expression $2! \times 3!!$ $(2 \times 6!)$ is the largest. By the way $2! = 2!! = 2!!! = 2$.
14. Andrea removed 7 coins having a total value of 82¢. She removed 2 pennies, 2 quarters, and 3 dimes.

15. The perimeter will increase by $(2 \times 5 + 2 \times 5)$ 20 m.

16. If I weigh 20 kg more than half of my weight, half of my weight must be equal to 20 kg. I must weigh $(2 \times 20 \text{ kg})$ 40 kg.

17. If you could spend \$1 every second, you could spend $(60 \times \$1)$ \$60 every minute.

18. A die is rolled once. The probability of getting a 6 is (1 chance out of 6 possible outcomes) $1/6$.

19. All even multiples of 3 are multiples of (2×3) 6. The first multiple of 6 between 0 and 100 is $6 = 1 \times 6$, the second is $12 = 2 \times 6$, the third is $18 = 3 \times 6$, The last multiple of 6 between 0 and 100 is $96 = 16 \times 6$. There are 16 even multiples of 3 between 0 and 100.
